**Biochar for Environmental Management** Johannes Lehmann 2012-05-16 Biochar is the carbon-rich product when biomass (such as wood, manure or crop residues) is heated in a closed container with little or no available air. It can be used to improve agriculture and the environment in several ways, and its stability in soil and superior nutrient-retention properties make it an ideal soil amendment to increase crop yields. In addition to this, biochar sequestration, in combination with sustainable biomass production, can be carbon-negative and therefore used to actively remove carbon dioxide from the atmosphere, with major implications for mitigation of climate change. Biochar production can also be combined with bioenergy production through the use of the gases that are given off in the pyrolysis process. This book is the first to synthesize the expanding research literature on this topic. The book's interdisciplinary approach, which covers engineering, environmental sciences, agricultural sciences, economics and policy, is a vital tool at this stage of biochar technology development. This comprehensive overview of current knowledge will be of interest to advanced students, researchers and professionals in a wide range of disciplines.

**The Dragon and the Elephant** National Research Council 2010-04-25 The return of the once-dormant economies of China and India to dynamism and growth is one of the most remarkable stories in recent history. The two countries are home to nearly 40 percent of the world's population, but until recently neither had played an influential role in the contemporary global economy. In the past two decades, China and India have liberalized internal economic policy, treatment of foreign investment, and trade, and have experienced economic growth at sustained high rates. From the point of view of the United States, however, the most important development in the Chinese and Indian economies in the long term may be the

strides they are making in developing their own domestic innovation capacities. After a long period of underinvestment, both countries have committed to growing their science and education systems to bolster research and further economic expansion. Some observers of the recent growth have said that both countries are surging in their efforts to spur innovation; others have emphasized the potential of one country over the other; and still others have suggested that both China and India have a long way to go before achieving innovation-driven growth. With such a range of views, The National Academies set out to describe developments in both countries, in relation to each other and the rest of the world, by organizing a conference in Washington, D.C. The conference, summarized in this volume, discussed recent changes at both the macroeconomic level and also in selected industries, and explored the causes and implications of those changes.
